## Improvements

### Admin

- Admin > Data Management > Student I/O > Student Import Defn: Added a new definition, COVID-19 Crisis Code Update. On the Enrollment tab > Other Annual Information, the Key Field maps to column B in the Crisis Code Students report (described below), and the Crisis Code maps to column D in that report. Then on the Details tab, select the file generated from the Crisis Code Students report as the Test File. WEB-3367

### Students

- Reports > Crisis Code Students: Crisis codes are required for all students enrolled on the last day of school. Added a filter to this report to include all students or only students assigned a reportable crisis code. We recommend running the report for all students to generate a spreadsheet that can then be reviewed. If students haven't had a crisis code assigned, WebSmart will generate a code, 00 Not assigned, which is a non-reportable code. You can review the spreadsheet, and enter reportable codes as needed. WEB-3368
- Scheduling > Schedule Manager  
This release includes multiple improvements to the scheduling process.
  - Eliminated the concept of schedule versions from the Schedule Manager. WEB-3318
  - Modified the schedule creation process by adding the option to create a schedule from scratch or by copying an existing schedule *and* by adding locked and transient states to the schedule. WEB-3319
    - The transient state allows you to create multiple schedules to use as "what if" scenarios to see if one of the schedules works better to fill sections. Once you've settled on the best schedule — the production version — you'll lock it and delete the ones you won't use.
    - A locked schedule can't be deleted. If you must delete a locked schedule, you must first remove all scheduling artifacts and reset the schedule to transient.
    - You can transition between transient and locked once the schedule is created by using the Schedule Status drop-down on the Attributes tab. WEB-3320
  - Bulk Tasks
    - Moved the Build Course Request bulk task from the old Versions tab. This task can be applied to all students or only students without schedules AND to all schedule tracks or a single schedule track. WEB-3321
    - Moved the Build Course Sections bulk task from the old Versions tab. This utility functions as before with the warning that system-generated sections will be deleted and re-created. WEB-3322
    - Moved the Build Student Schedules bulk task from the old Versions tab. This task now includes the options to limit the scope by students, terms, and schedule tracks. WEB-3323
    - Added the Reassign Schedule Tracks utility to this tab. Use the Enroll Students command to enroll students who aren't associated with a schedule track. Use the Transfer Students command to transfer students enrolled on the selected schedule track to another schedule track. WEB-3324

## Bugs Fixed

---

### *Compliance > State > Texas > TSDS*

- PEIMS: Removed the TX-FamilyEngagementPlanLink from the Summer submission. It's only to be reported on the PK ECDS in the InterchangeEducationOrganizationExtension. WEB-3415

### *Finance*

- HR > Staff Manager > HR Info > Additional Allowance Elections: Now, when updating an additional allowance, you may select the *Use employee's primary position* option, and when the election is added to an employee at payroll, the position type will be derived from the contract. WEB-3412
- Payroll > Processing > Payroll Batches > Scheduled Payments > Payroll Payment Detail
  - Additional earnings with the same state position as the employee's primary position no longer generate the error message that "You may not flag a supplement as part of contractual primary role for a state position not represented on the contract." WEB-3417
  - The YTD statutory aggregator now correctly handles void checks when calculating annual gross values in the respective categories. WEB-3411

### *Students > Scheduling > Schedule Manager*

- Course Completion: This process now accurately codes pass/fail codes when modifiers are assigned. WEB-3075
- Periods: The changes to the scheduling process fixed a bug causing periods to not be copied when copying an existing schedule. WEB-2346
